

Education and technology

H. S

I believe technology can improve the Japanese education system by managing personal data and giving an opportunity to students.

First, technology can make it possible to supply more personal and efficient learning by using data. I think using some terminals or applications lead us to have a high level education. Because the terminals are able to preserve data, the teacher can know how much the students understand and can analyze them. Then, the teacher can give more specific and valuable advice. Students can understand more than studying normally. While I stayed home because of COVID-19, I had to fill out the questionnaire every day to let the teacher know how much I understood the homework and tell my worry about a new school life at high school. For example, if I said I couldn't watch the math video that I had to watch for that day's homework, some teacher would call me or mail me and let me know how to see it.

Second, we can have more chances by using technology. For example, we can have video-recorded classes. Teachers can record the class so that students can watch the class if they can't come to school because of injury or when they are afraid of COVID-19. They can also watch it if they want to review the class. We can review it anytime and whenever we want because of it. As for me, I am taking an online English class every Monday. Because it is online, I can prepare until the very last minute. I am very thankful because there are few English teachers around me. The students are from many places in Japan such as Tokyo and we are having a high-level English class thanks to the internet. In addition, we can have a virtual school trip by using Google Maps. Because of it, we can go to many places all around the world. It's free to go on the trip because we don't have to fly or use a bus. It's safe because we don't actually go there. This year many schools had to abandon their school trip or accommodation training. However, when we use Google Maps, we can imagine and feel the landscape by searching the place where we want to go.

Because of all the reasons above, I think technology such as online class, video recording, and tablets can make it possible for the Japanese education system to get to a higher level.
