How can we help solve global warming?

H. F

I think the most serious environmental problem is global warming.

First, I'd like to introduce the reason why I think global warming is a serious environmental issue. It affects the whole world. For example, the sea level is rising, more animals are going extinct, and more abnormal and unpredictable weather happens. If it's warm, the ice caps will melt and become water, then the amount of water in the ocean will increase. Therefore, some countries will sink into the sea. If it's warm, it'll be difficult for some animals to live. Therefore, endangered species will increase. If it's warm, the seasons will change. If it's warm, we will have to use the air conditioner. Therefore, we must pay a lot of money for the electric bill. Therefore, we should solve global warming to help these problems.

Second, what causes global warming? It's air pollution. There are many things that cause of air pollution. Cars, factories and burning fossil fuels produce carbon dioxide. Deforestation is one of the biggest causes of global warming. Now, forests around the world are decreasing. Trees absorb carbon dioxide. If forests decrease, global warming will get worse. Therefore, helping solve deforestation is helping solve global warming. By the way, deforestation affects other things. Decreasing forests will influence the ecosystem. If plants decrease, insects and animals which eat the plants will decrease. Then animals which eat them will decrease. Therefore, the ecosystem will be destroyed by this chain reaction. Then, deforestation influences the soil. The soil is held together by the roots of the forest. This is important for avoiding soil erosion. Without the trees, the soil will be washed away by the rain. It will be difficult to grow vegetables and feed animals and humans. Therefore, it is also important to solve deforestation not only for global warming, but for life on Earth.

Third, what can we do to help prevent global warming? There are four things we can do to help. First, we should use renewable energy. For example, solar panels, wind turbines and hydropower. Second, we should use eco-friendly utilities. For example, we can drive electric cars. Third, we should live sustainably. For example, we can save energy by turning off electric utilities when we don't use them. Fourth, we should reduce plastic trash by using eco-bags. In addition, preventing deforestation is also important for solving global warming. There are four things we can do to help deforestation. First, we shouldn't use disposable items such as paper cups. Second, we should use recycled paper. Third, we should recycle items that can be recycled, such as milk cartons. Fourth, we should buy products which are friendly for the environment. For example, we can look for products with green and eco marks. By doing so, we will be able to solve this problem. If we do these eight things, we will be able to solve global warming.

In conclusion, I think global warming that influences other environmental problems is the most serious environmental problem. We should do all that we can to help.
